

Sectum AI - Verification Evidence Pack

Run erasure-7cd276c8

Verification summary

Run started: 2026-06-15T16:59:26.276767+00:00

Run finished: 2026-06-15T16:59:26.277372+00:00

Findings recorded: 0

Confirmed cross-tenant findings: 0

Scope and methodology

Sectum AI provisions synthetic tenants seeded with cryptographic canary markers, recorded in a hashed ground-truth manifest. Probes run from each tenant's session against the configured surfaces; this pack attests the isolation of those surfaces under the run's scenario.

Each observation passes a layered detector - exact canary match, then semantic similarity, then a calibrated judge. A confirmed finding is a marker owned by one tenant observed in another, traceable to the manifest, so confirmed findings carry no false positives; a candidate that cannot be tied to a manifest marker is recorded as unverified rather than confirmed.

Scope is limited to the probes and surfaces exercised in this run, against the test condition fixed by the manifest hash below. Sectum verifies and attests; it does not remediate - findings carry remediation pointers, not changes - and this pack asserts test coverage, not legal certification.

Findings

No findings were recorded for this run.

Coverage & caveats

Surface	Verdict	Meaning
vector_db	ERASED	verified clean - no marker survived erasure
tracing	ERASED	verified clean - no marker survived erasure
agent_memory	ERASED	verified clean - no marker survived erasure
semantic_cache	ERASED	verified clean - no marker survived erasure
model_adapter	ERASED	verified clean - no marker survived erasure
search_index	ERASED	verified clean - no marker survived erasure
eval_set	ERASED	verified clean - no marker survived erasure
backup	ERASED	verified clean - no marker survived erasure

Coverage states what this attestation verified, surface by surface. A NOT_COVERED surface was out of scope, had no configured adapter, or showed no pre-erasure baseline - it is explicitly not evidence of erasure and must not be read as erased. ATTESTABLE WITH CAVEAT means the backend exposes no per-tenant erasure API, so the data is presumed retained until it ages out of the backend's retention window (a backend limitation, not a flow failure).

Compliance control coverage

SOC 2 (TSC) (CC6.1, CC6.6, CC6.7): Tenant logical separation tested by benign and adversarial probing across the AI surfaces.

ISO/IEC 27001:2022 (A.5.15, A.8.3, A.8.12): Cross-tenant information leakage tested; residual leakage itemized.

ISO/IEC 42001:2023 (A.6.2.6, A.7.2, A.7.5): Per-tenant data management and provenance in the AI system tested; isolation verified under AI system operation and monitoring.

GDPR (Article 17, Article 25, Article 32): Erasure across the AI surfaces verified; tenant isolation tested.

CCPA/CPRA (1798.105, 1798.100, 1798.150): Deletion of a consumer's personal information across the AI surfaces verified; segregation of consumer data tested.

EU AI Act (Article 15): Robustness of tenant isolation tested under benign and adversarial conditions.

HIPAA (164.312(a)(1), 164.312(c)(1), 164.312(e)(1)): Segregation of regulated tenant data verified across the AI surfaces.

NIST AI RMF (MEASURE 2.7, MANAGE 2.x): Documented measurement of multi-tenant security risk.

OWASP LLM Top 10 (LLM08:2025): Direct test coverage of vector and embedding multi-tenant weaknesses.

These control mappings assert that Sectum AI produced test-coverage evidence for the named controls. They are not a legal certification of compliance and do not substitute for an audit or a Data Protection Impact Assessment.

Integrity and independent verification

Run digest (SHA-256, run identifier):

c7588357097efbd400a58b0b465ea559a7bb33ead13c6f65d746350c574a26c4

Manifest hash: b8236a0e14d14c15fe2e6206e17fe4008f9f3c89992ee9eb25345259431b1c27

Verify this pack independently by running 'sectum-ai verify' on it. That recomputes the whole-pack attested digest - over the run record, the manifest hash, the control mappings, and the PDF reference - and checks it against the timestamp token (and the Rekor inclusion proof when present). The run digest above is the run's identifier, not the value checked against the token; any edit to the attested content changes the attested digest and fails verification.
